

**METHOD AND SYSTEM FOR AUTOMATICALLY DISPLAYING
AN IMAGE AND A PRODUCT IN A PAGE BASED ON CONTEXTUAL
INTERACTION AND METADATA**

Abstract of the Disclosure

5 The invention provides a method, system and computer-readable medium for
storing images with related information in a relational database and using the
information to order available products for a selected image over a network. Tag and
business information may be associated with an image in the database and a unique
image identifier is generated for each image. Different types of searches of the relational
10 database may be performed including product based and image based. Affirmative
results from searches are returned as images and/or products that are displayed in pages.
The returned images also include information indicating available products. The
selection of a returned image causes a cut-down version of the image and all of the
available products to be displayed in the same page. When an available product is
15 selected, a server enables a transaction for a user to order the selected product. A Hyper
Text Transport Protocol (HTTP) Cookie is employed to store a copy of a client identifier
at a client. Information associated with the client's behavior for each session is stored in
a profile that is used to customize the particular options and products that are displayed
to the user. A combination of user information, product information, image information
20 and contextual interaction information is used to determine the display of the images and
the products.
